Kershaw Group Ltd. confirms that in the course of the last year it implemented the Statlook system for managing IT resources, including an inventory of hardware and software, as well as monitoring user activity. The application is used to provide surveillance over the operation of 130 devices situated in the main office and with roaming users. It should be emphasized that the software definitely facilitates the daily administration of the network and directly influences both the general improvement of the IT infrastructure and increases the security of the IT system. Statlook can be very easily controlled by system admins and all risky behaviours can be prevented. The program can also be used to assess the efficiency of work and the effectiveness of the use of IT resources, thus allowing to justify any investment needs. This is complemented by excellent technical support and full user support.
